

Voice over Internet Protocol (VoIP), is a technology that allows you to make voice calls using a broadband Internet connection instead of a regular (or analog) phone line. VoIP services convert your voice into a digital signal that travels over the Internet. If you are calling a regular phone number, the signal is converted to a regular telephone signal before it reaches the destination.

The technology has seen an increased presence within the last five years because VoIP service providers often offer lower rates than traditional phone companies, while providing increased functionality and flexibility compared to analogue phones. With an IP phone solution, all of your local and long distance calling are included in your low monthly rate.
